FINAL PROJECT

Professors: Giorgio Delzanno, Davide Ancona

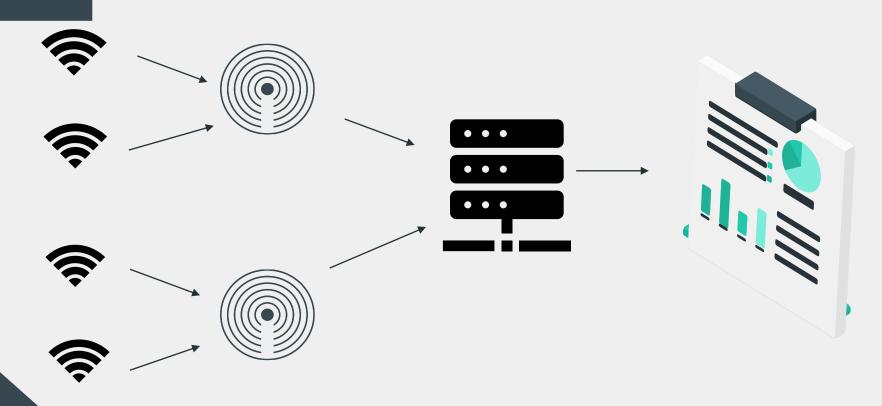

Sahitya Reddy Bollavaram - 4849759

INTRODUCTION

The goal of this project is to estimate the number of people in a building with the help of Beacon Technology. The project consists of four parts which are following

- A beacon simulator which emits beacons.
- Beacon Scanner installed on devices in specific locations in the building which scans nearby beacons from time to time and sends signals to the server.
- A server that collects scanned data and sends alarms to users (is this case
 just admins)
- A dashboard that shows live data and statistics of real and historical data.

ARCHITECTURE

BEACON EMITTER

BEACON SCANNERS

SERVER

DASHBOARD

TECH STACK

- Beacon Simulator Nodejs Bleno Library
- Beacon Scanner Nodejs Noble Library
- Server- Mosca with MQTT Broker for Live data and HTTP Rest Protocol for Historical Data
- Dashboard React as MQTT Subscriber

BEACON SIMULATOR

The simulator emits a beacon with UUID (iBeacon Format), however this can be customized with more properties such as name, major, minor versions etc.

BEACON SCANNER

The following information is captured by the scanner.

- Beacon ID
- Beacon Entry Time
- Beacon Exit Time

This data is sent as a signal on a particular topic via the server.

SERVER - MOSCA WITH MQTT BROKER

Functionality:

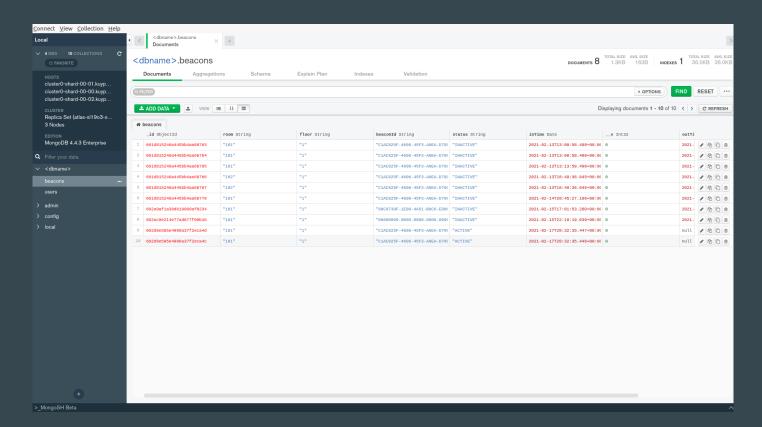

- Sends signals when a room has reached the threshold.
- Sends an alarm(SMS) to the admin.

SERVER FOR REST SERVICES

Services for Analytics

- Sends data on request to the dashboard (Rest Service)
- Active Beacons in each room (/beacon/count)
- Exited Beacon Duration for today. (/beacon/duration)
- Beacon Count per every 2 hours (assuming that each lectures lasts for 2 hours) (/beacon/durationPer2Hours)

DATABASE

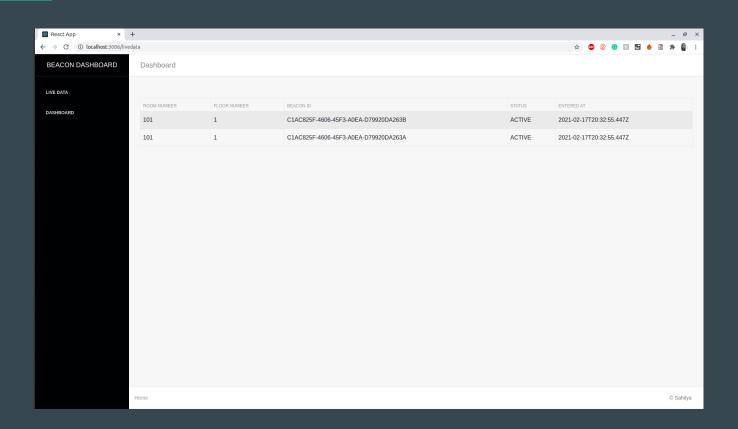

CLIENT - DASHBOARD USING REACT

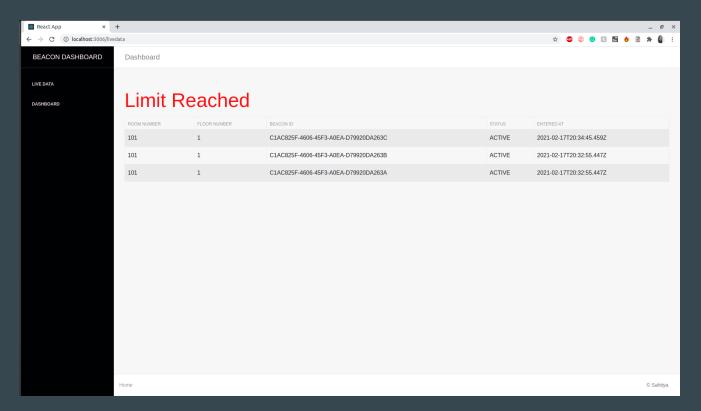

The Dashboard consists of 2 routes.

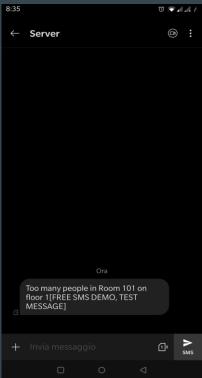

- Live data
- Statistics

CLIENT - LIVE DATA

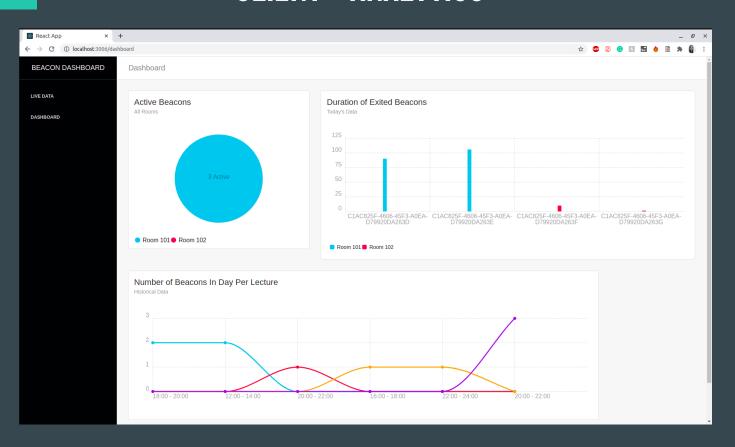

CLIENT -LIVE DATA

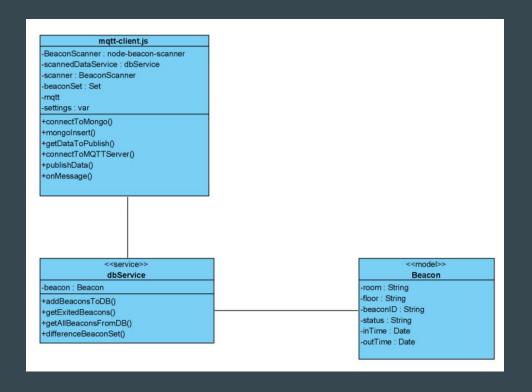

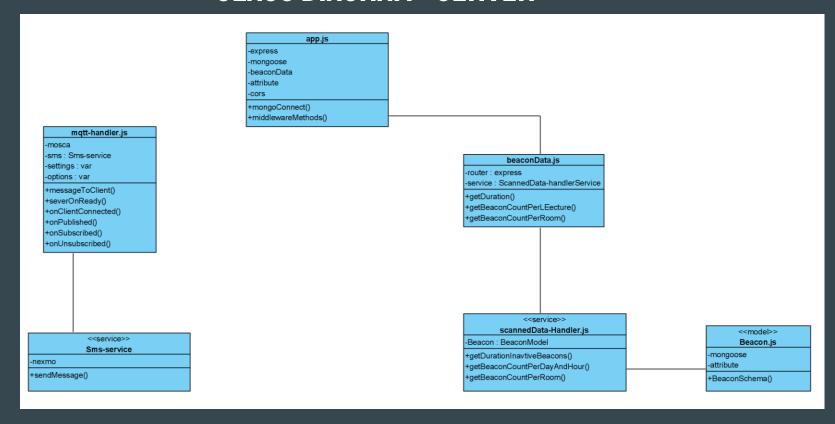

CLIENT - ANALYTICS
